

October 11

How do you find a local minimum?
How do you find a point of inflection?

October 11

Students will verbally explain how to
evaluate integrals
(using the words:
antiderivative, constant, substitution...)

5. A cubic polynomial function f is defined by

$$f(x) = 4x^3 + ax^2 + bx + k$$

where a , b , and k are constants. The function f has a local minimum at $x = -1$, and the graph of f has a point of inflection at $x = -2$.

- (a) Find the values of a and b .

- (b) If $\int_0^1 f(x) dx = 32$, what is the value of k ?

$$f'(x) = 0 \quad f'(-1) = 0$$

$$f''(x) = 0$$

$$f''(-2) = 0$$

Question 5

A cubic polynomial function f is defined by

$$f(x) = 4x^3 + ax^2 + bx + k$$

where a , b , and k are constants. The function f has a local minimum at $x = -1$, and the graph of f has a point of inflection at $x = -2$.

- (a) Find the values of a and b .

- (b) If $\int_0^1 f(x) dx = 32$, what is the value of k ?

$$\begin{aligned} \text{(a)} \quad f'(x) &= 12x^2 + 2ax + b \\ f''(x) &= 24x + 2a \end{aligned}$$

$$f'(-1) = 12 - 2a + b = 0$$

$$f''(-2) = -48 + 2a = 0$$

$$a = 24$$

$$b = -12 + 2a = 36$$

$$\begin{aligned} & \left[\begin{array}{l} 1 : f'(x) \\ 1 : f''(x) \\ 5 : \left[\begin{array}{l} 1 : f'(-1) = 0 \\ 1 : f''(-2) = 0 \\ 1 : a, b \end{array} \right] \end{array} \right. \end{aligned}$$

$$\begin{aligned} \text{(b)} \quad \int_0^1 (4x^3 + 24x^2 + 36x + k) dx \\ = x^4 + 8x^3 + 18x^2 + kx \Big|_{x=0}^{x=1} = 27 + k \end{aligned}$$

$$\begin{aligned} 27 + k &= 32 \\ k &= 5 \end{aligned}$$

$$\begin{aligned} & \left[\begin{array}{l} 2 : \text{antidifferentiation} \\ \quad <-1> \text{ each error} \\ 4 : \left[\begin{array}{l} 1 : \text{expression in } k \\ 1 : k \end{array} \right] \end{array} \right. \end{aligned}$$
